

SUMMARY

Solo founder and engineering student building production AI and web systems end to end: database, backend, interface, deployment, and support. Founded and personally operate Ostazi, a live two-sided tutoring marketplace serving students across Syria. Twelve public and private systems shipped with documented test coverage, including a cross-platform AI decision-model port (Apache-2.0), a multi-agent task router, and a deterministic security log analyzer. Comfortable owning a project from a client's idea through a live, maintained product.

FOUNDER EXPERIENCE

Founder & Sole Developer
Ostazi · ostazi-edu.com

2026 – Present

- Designed and built a two-sided tutoring marketplace for Syria from zero: phone/OTP auth, a full booking state machine, and a versioned commission ledger for auditable payouts.
 - Shipped verified-teacher onboarding, institute and school account types, and an internal admin operations panel.
 - Own the full stack in production — database schema, API, frontend, deployment, and post-launch support — with no other engineers.
- Next.js · NestJS · PostgreSQL · Prisma · Vercel

Freelance Web Developer
Alwazzour Technical Supply · Damascus, client project

2026

- Took a Damascus technology-supply business from no online presence to a live, fully Arabic right-to-left storefront with a working product-inquiry flow.
 - Site is in daily use by the business owner for real customer inquiries.
- Next.js · Arabic RTL · Vercel

SELECTED PROJECTS

- Laya Windows**
— typed-decision AI model, ported to Windows
Public, Apache-2.0
- Ported a calibrated typed-decision model off Apple-exclusive Core ML onto ONNX Runtime and DirectML, so it runs on any DirectX 12 GPU on Windows.
 - Built a first-class Arabic evaluation suite the original project did not have; documented in 10 languages.
- Open Axis**
— multi-agent task router
45/45 tests passing
- Routes engineering tasks across Claude Code, OpenCode, and Codex with capability-tier routing, deterministic fallback, and durable task state. In daily personal use.
- Kyros**
— deterministic AI task-routing dispatcher
16/16 tests passing
- Master/worker control loop where a planning model routes work to a local model fleet, serialized through a GPU mutex, with auditable tier selection.
- AI Security Log Analyzer**
— deterministic threat detection
12/12 tests passing
- Rule-based detection for brute force, impossible travel, and port scans; a local LLM only summarizes an already-detected incident, never the detection itself.

EDUCATION

B.Eng., Artificial Intelligence & Cybersecurity
Syrian Private University

In progress

LANGUAGES

Arabic Native
English IELTS 6.5 Overall

TECHNICAL SKILLS

AI / LLM Engineering
Local LLM deployment (Ollama), RAG pipelines, tool-calling agents, hallucination-guard design, prompt engineering

Web & Product
Next.js, React, TypeScript, NestJS, Arabic RTL interfaces, auth & booking flows, Vercel deployment

Data & Automation
ETL pipelines, data validation and cleaning, SQL, relational modeling, Python, browser automation

Security & DevOps
Threat-detection logic, secret scanning, secure configuration, Git, CI-style verification, Docker

OPEN TO

Remote roles in AI, data, automation, growth, or content, and product builds for founders who want an idea taken to a live, working system.
